

Dasher

Settings + onboarding

2021

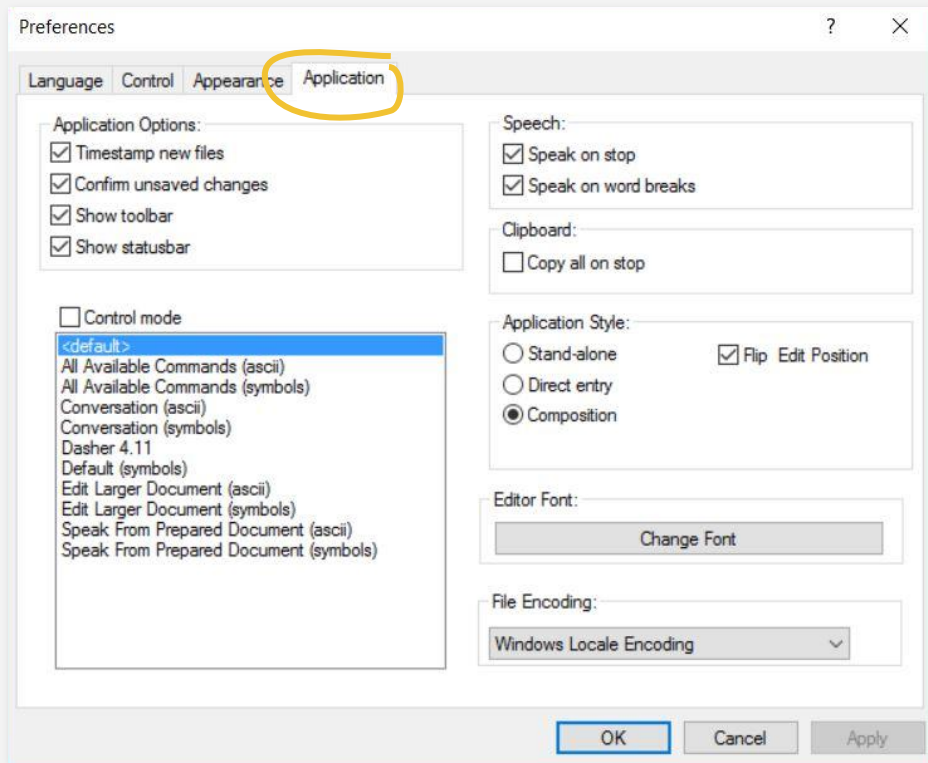

Please note that included screenshots are intended to serve as conversation starters rather than design proposals.

Categorization

- Is the current tab grouping and labeling clear?

Grouping possibilities:

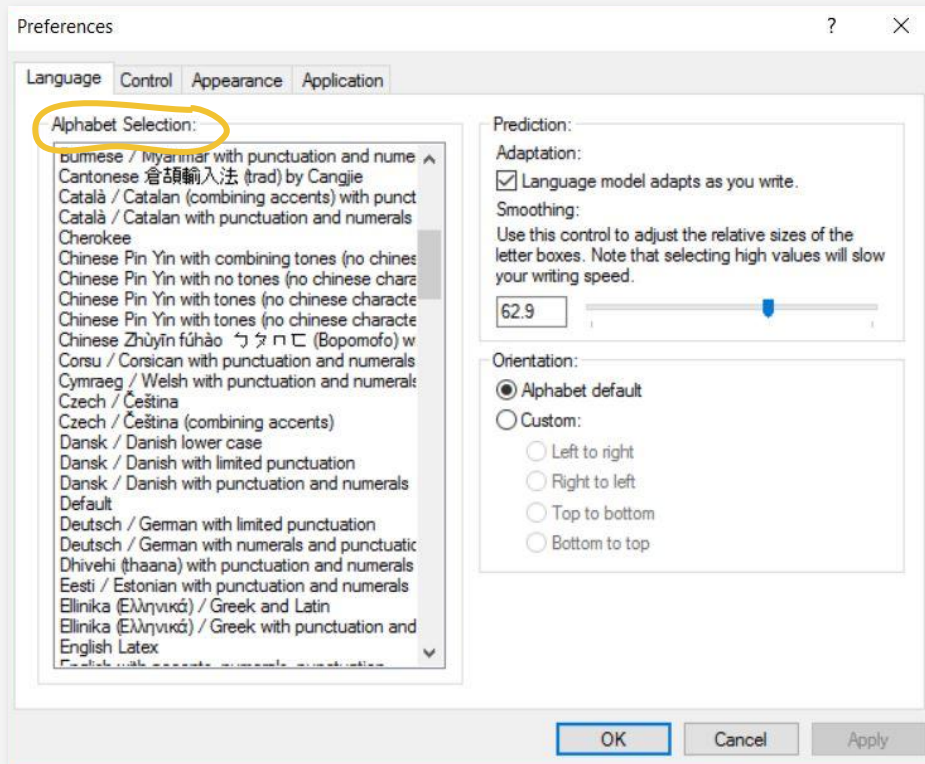

- Keep descriptive groups but update language
 - “Application” is perhaps vague. “Interface?”
- Consider grouping according to usage rather than content
 - An “advanced settings” tab might contain rarely used options.

Prioritization

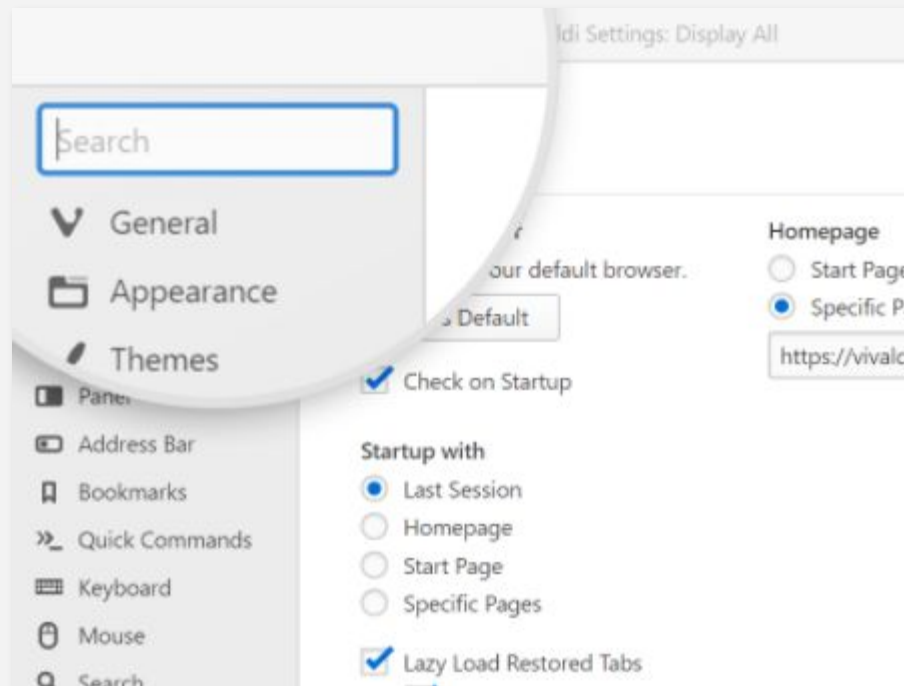

- Upon opening “Preferences,” what do users need/want to view first?
 - “Alphabet Selection” seems like a “set it and forget it” setting and perhaps shouldn’t be so prominent
- What settings do users change most frequently / on the fly? Is there anything else that might be pulled into the interface itself?
 - Speed?
 - Training texts? *Where do users change training texts anyways?*
 - Text box location?

Speed: 1.01 Alphabet: English with limited punctuation
English with limited punctuation
Cymraeg / Welsh with punctuation and numerals
Czech / Čeština (combining accents)
English with limited punctuation
More Alphabets...

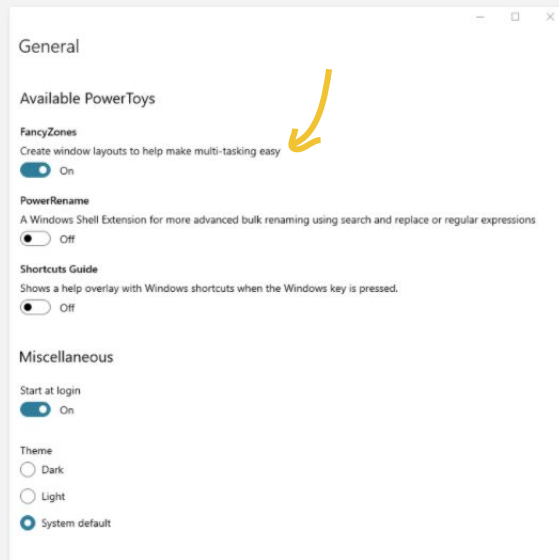

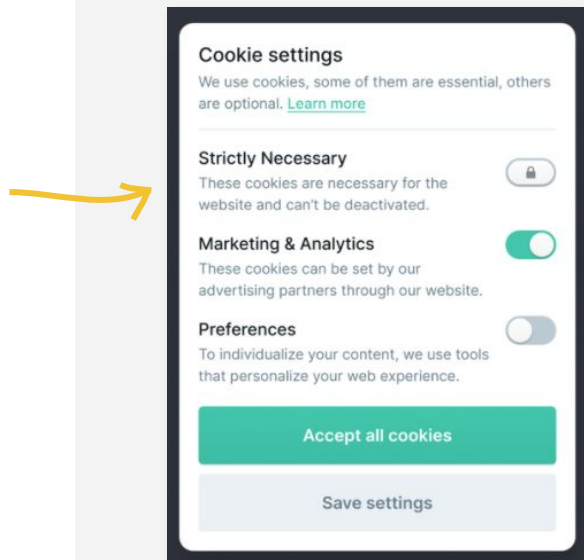

Wayfinding

- Add a universal search option so that users can navigate to settings without exploring the tabs?

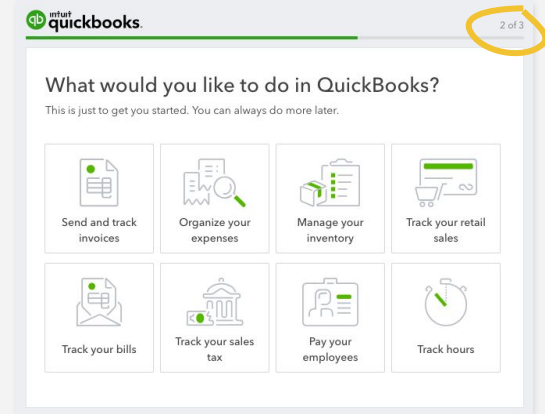

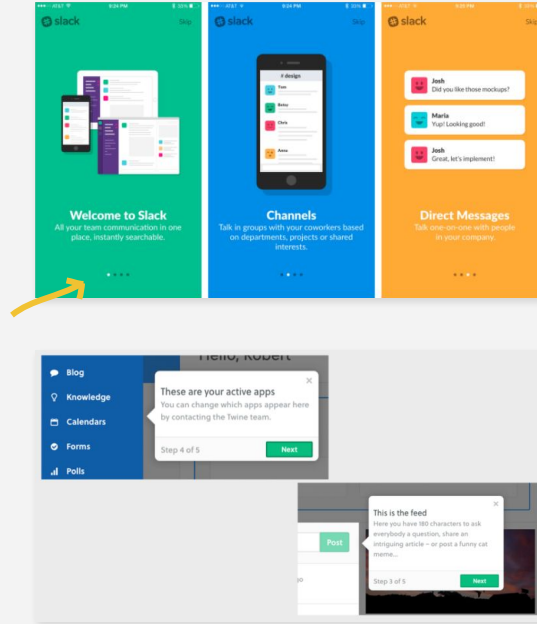

Helper text

- Provide helper text or tooltips to clarify possibly vague terms?

Onboarding UX

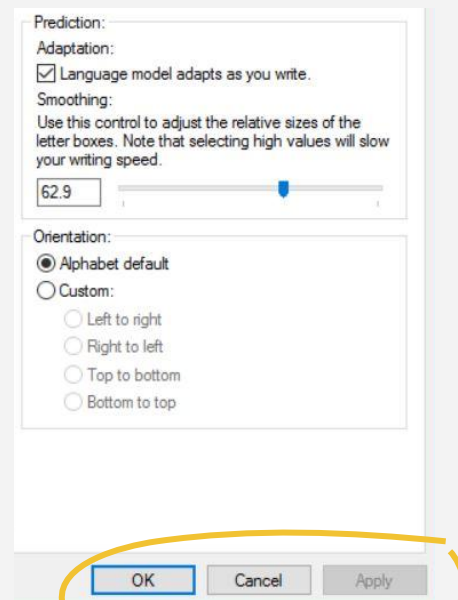

- Provide a click through onboarding experience including:
 - High level info about Dasher
 - Configuration setting “hand-holding”
 - Suggestions about the best beginners settings
- Use tooltips to call out new features or to explain the interface?

Settings preview

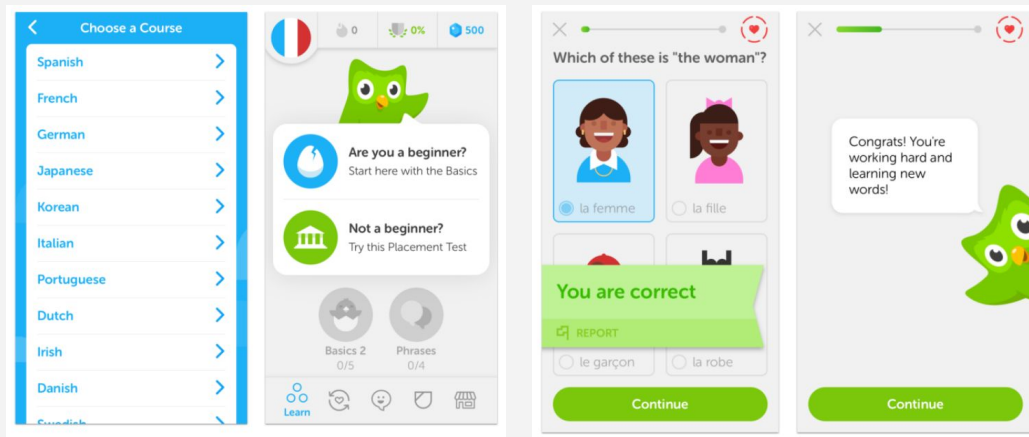

- Provide an interactive preview within the the “Preferences” window so that users don’t have to click “Apply” then relocate the window each time they would like to see/try a new setting in context
- Another possibility would be a split screen view.

I'm curious about whether this would be technically feasible

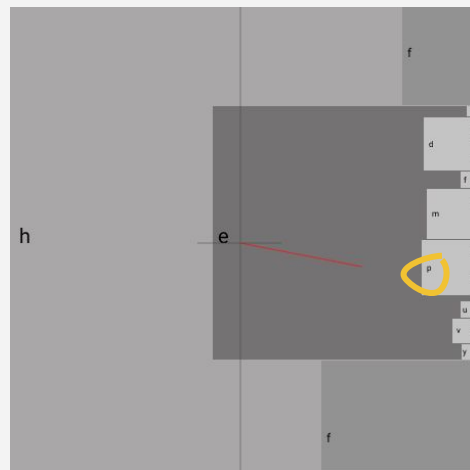

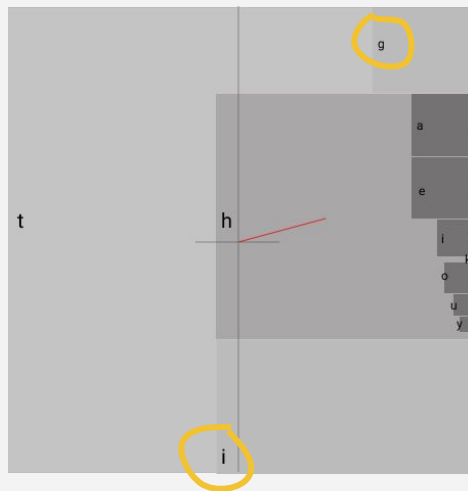

Onboarding games

- Provide step by step instruction about how to use Dasher
- Provide a guided challenge or game mode that corrects a users' mistakes and provides helpful tips. *Excuse the silly examples*

Onboarding games

- Possible interface simplification during onboarding game/beginner mode:
 - Do not show the children of the siblings to the “over the axis” square.
For example in the left image “g” and “i” ARE visible, but their children are NOT visible.
 - Highlight the relationship of sibling boxes within an “over the axis square” by giving them all the same color and hiding JUST the shape of their child boxes.
For example in the right image “p” has visible child letters, but their boxes are not visible yet.

Design System

- Use Google material design to create a set of clear / consistent / modern looking components that define the Dasher onboarding and settings experience.
- This wouldn't necessarily need to affect the actual zooming area (more so the settings.) But, it might simply mean a different default font or color scheme.
